PROFESSIONAL SUMMARY

I'm a software engineer and AI data evaluation specialist with over two years of experience improving data quality and building Python-based workflows. At CloudFactory, I redesigned our verification process and lifted data accuracy by 20%. These days I write benchmark tasks and evaluation rubrics for AI training platforms, working independently, hitting deadlines, and giving clear, structured feedback across annotation and QA work.

CORE AI & TECHNICAL SKILLS

AI Evaluation: LLM output evaluation, benchmark/task authoring, rubric design, AI-generated code evaluation, annotation, error classification, factuality and instruction-following assessment, quality scoring.

Programming & Data: Python, JavaScript, HTML5, CSS3, XML, SQL (basic), CSV processing, validation, automated reporting.

Backend & Tools: REST APIs, Flask, Git/GitHub, Linux CLI, Postman, Docker (basic), AWS/GCP (foundational), Vercel.

Work Practices: QA/QC, debugging and testing, OOP, SDLC, Agile/Scrum, async communication, documentation-driven workflows.

EXPERIENCE

AI Data Platforms (Multiple Clients) | AI Training & Evaluation Contractor

Remote | 2025 to Present

- Write benchmark tasks for AI platforms, including problem statements, reference solutions, and grading rubrics, each one reviewed by the platform before it goes live.
- Build coding benchmarks that test AI-generated code for correctness, efficiency, and whether it actually follows the instructions it was given.
- Review model outputs for accuracy and reasoning quality, then write up structured feedback the training team can act on.
- Write annotation guidelines and label datasets for classification and error tagging, making a deliberate effort to cover tricky edge cases.
- Juggle several contractor engagements at once, working independently and consistently hitting submission deadlines.

CloudFactory | Associate, Data Operations

Hybrid · Remote | 2023 to 2025

- Processed and validated large volumes of invoice, receipt, and transcript data for enterprise clients, staying above the team's accuracy benchmark.
- Redesigned the verification and QC workflow, which lifted data accuracy by 20% and cut down on rework later in the pipeline.
- Delivered image, text, and video annotation for ML training datasets, keeping agreement consistent across annotators.
- Worked with remote teams across several projects at once, coordinating through Slack, Jira, and Trello.

SELECTED PROJECTS

LLM Evaluation & Benchmark Platform

Python, FastAPI, React, PostgreSQL

Built a platform for evaluating LLM responses, using structured rubrics, reference answers, comparative scoring, and a set of edge-case tests to stress-test outputs.

Data Quality & Annotation Pipeline

Python, Pandas, SQL

Built a pipeline that cleans and validates datasets, classifies errors, handles annotation, and produces automated QA reports.

AI Code Evaluation Benchmark

Python, pytest, Docker, GitHub Actions

Created coding benchmarks with reference solutions and hidden tests, used to check AI-generated code for correctness, edge cases, and whether it follows instructions.

Python Data Processing Pipeline

Python, Pandas

A modular pipeline that cleans, validates, and analyzes CSV datasets, with automated reporting and error handling built in.

REST API Integration Application

Python, REST APIs, Postman

A Python app that pulls from live third-party APIs, handling authentication, rate limits, response parsing, and validation.

EDUCATION

Software Engineering Program | Moringa School

Completed Aug 2025 to Feb 2026

Artificial Intelligence (Part-Time) | Moringa School

Completed February 2026

REMOTE WORK READINESS

Available full-time, based in UTC+3. I have a reliable fibre connection with backup power, communicate fluently in written and spoken English, and I'm used to working async with documentation-first habits.
